

Honeybee Bio Resin

AVAILABLE AT THE DONGHIA
MATERIALS LIBRARY

Propolis is a biodegradable resin that honey bees collect from different trees and use as a sealant for unwanted open spaces in the beehive. Its color depends of the forests and botanical sources used in the collection by the honey bees. The most common one is brown, but there are plenty of variations in colors and properties. This particular black propolis is from rubber trees.

*NOTE: This material is currently sourced from only 500 beehives, yielding only 30-50 kilograms per year. It is thus a very precious and unique material.

CATEGORY

Pourables and Aggregates, Propolis

MANUFACTURER

Marléne Huissoud

MATERIAL COMPOSITION*

The propolis, at its first stage, is a mix of between 50 to 150 different components (wax, balsams, resins, pollen, essential oils...). Refining by boiling in water allows the impurities to leave the propolis and be used as a precious finish on art pieces and furniture.

**as reported by the manufacturer*
